

Installation Guide : Generative AI

[Link](#) to the project (GitHub)

Download the .zip file. You may face an issue concerning the right access. DM me in this case.

Extract the folder to the desired location.

- Alternative for those who want to modify the repository

▶ Install the Python libraries.

Requirements :

Need Python 3.10.6 (>3.9 at least)

Navigate to the *generative_ai-main* directory where you will find the *requirements.txt* file.

💡 These are all the Python libraries needed to run the project.

Type `cmd` in the top bar and proceed to the next step.

Delete and type "cmd", which will open a command window

► Alternative for those who want to go further

In your command window type the following command:

```
python.exe -m pip install --upgrade pip
```

if you've just installed python, this will allow you to download the latest version of pip.

```
pip install -r requirements.txt
```

⚠ This will work if you're in the right folder containing the *requirements.txt* file.

If all goes well, you now have all the libraries you need to get the project up and running.

If not you will probably need to install Pytorch or install additional library with pip.

Pytorch and any conflicting libraries may need to be reinstalled manually to solve issues with Jupyter Notebook for testing folder.

▶ Open the project in Unity Hub

⚠ Requirements :

Need Unity installed, with the version 2022.3.12f1

Need Oculus (if using a Meta Quest VR headset)

Need Visual Studio Code

Need Git Bash

If you've downloaded version 2022.3.12f1 with the link, you'll need to add it to Unity Hub.

(see below)

You need to add your project to Unity Hub

You will need to turn of safe mode, due to some external library.

Unity Configuration

Make sure the OpenXR box is checked on the computer and on Android (yellow circle).

In the OpenXR menu, you need to add the interaction profiles if you don't want to bother adding every name containing "Controller". And do the same with android.

The right scene is OpenXR.

Launch the demo

 Connect your VR headset to your computer or just with a microphone and a keyboard

 For the VIBE you need to have one base station at least

You need to run a python script and then click on  in Unity.

```
python run.py python -p dual -v full_system
```

 you need to have your `cmd` in **Project\generative_ai-main\Assets\Python\root** ([click to see how to get there](#))

```
py -3.11 run.py python -p dual -v full_system
```

Try this command if previous one does not work.

And that's it.

💡 The first time, your computer will have to download all LLMs models, which may take some time.

► Network information

▶ Play

To activate the microphone, use the space bar (1 press). The sphere will turn green if it's working properly, which means the system is listening to you. Then press "a" to stop recording.

💡 You need to click in the Game Display before pressing the space bar

Like this.

It will then create what you say. For example, "Create a sword."

Types of User Experiences: Activate the microphone and say commands like

- **Object Generation:**
 - Create a
 - I am holding a ...
 - Make a ...
- **Skybox Generation:**
 - I am standing in
 - Make a skybox of ...
 - Make the sky
 - I am surrounded by
- **MultiObject Generation:** (May end up in regular object generation if words like setup/array are not used, and the setup name doesn't intrinsically mean multiple objects)
 - Create a ... room setup
 - Create a setup of ... objects
 - Create an array of objects
- **NPC Creation:**
 - I am speaking to ...
 - Make/Create a [person]
- **Conversation:**
 - Ask any sort of question without using creation/command words
 - What is/How does/When did/Why does/Who is/Where is ...

Controls

1. Joystick Right : Snap turn
2. Joystick Left : Continuous movement
3. Trigger (both) : Teleportation
4. Grip (both) : Grab objects
